MOTOR INSTRUCTIONS

This motor is intermittent duty, which means that it should not run for long periods of time continuously. It is made for start and stop operations only, such as required by bag closing.

Brushes should be inspected at regular intervals so that wear can be detected, and replaced before they are about \(\frac{1}{0} \) in length. To remove brushes, take out two screws from each side of motor; when replacing brush, be sure it is replaced at the same axial position as removed. If it isn't, excessive sparking and loss of power will result. New brushes are furnished with machine and can be purchased from us at any time.

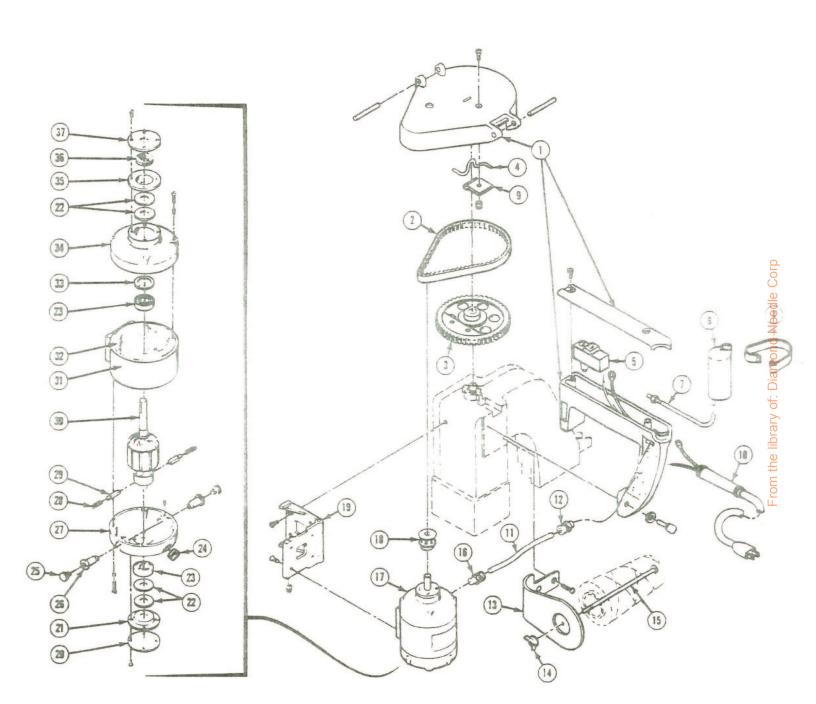

No motor will operate properly unless the bearings are kept well lubricated. Ball bearings are packed with grease sufficient for a period of from one to two years, depending on the service given the motor and temperature of the room in which it operates. To refill, remove the end caps covering the bearings and clean out the old grease before putting in the new. If the ball bearings are removed for washing in gasoline, the built in grease seal should be facing toward the motor interior when replaced. Use only well known make of SODIUM BASE BALL BEARING GREASE.
